Q.B. 6  
C/6

E. DEVILLE, ESQ., LL.D.,  
Surveyor General.

SIR,—

I have the honour to submit herewith a catalogue of stars prepared under my direction, giving the mean positions for 1910.0 of all stars plotted on the latitude star charts. This catalogue has been prepared for the purpose of facilitating field computations and dispensing with the necessity of star catalogues in the field. I believe it will prove to be a great convenience to those surveyors taking latitude observations.

Respectfully submitted,

G. BLANCHARD DODGE,  
*Chief of Special Surveys Division.*

## INTRODUCTION.

**A**N observing list for the determination of latitude by Talcott's method, when confined to one catalogue, will give long intervals between pairs in the latitudes covered by Dominion Land Surveys, and one night's observing is not likely to give the surveyor many pairs of stars for his determination. The preparation of a list where a number of catalogues has to be consulted is a laborious task, and one which requires a considerable amount of time. Surveyors on base lines and meridians have not much time to spare, nor are they in a position to know for more than two or three days ahead at the extreme, just where an observation will be taken. Again, in the country where these surveys are now being projected, every additional pound of outfit required is a matter for consideration, and the surveyor resents the extra weight necessitated by the carrying of a number of star catalogues. It was for these reasons that, in 1910, star charts were published for facilitating the selection of stars. These charts contained all stars up to the seventh magnitude from  $5^{\circ}$  south declination to  $90^{\circ}$  north given in the Berliner Jahrbuch, British Nautical Almanac, Star List of the American Ephemeris, and *Connaissance des Temps* for 1910, Greenwich Second Nine-Year Catalogue for 1900, Greenwich Second Ten-Year Catalogue for 1890 and Ambronn's Sternverzeichniss for 1900. The positions were reduced to a common epoch of 1910.0.

So far as the observing list was concerned, the charts dispensed with the need of the catalogues, and, moreover, while a list for a whole night's observing when prepared from the several star catalogues mentioned was a task of three or four hours' duration, the same list could be prepared from the charts in half an hour's time. But if the surveyor was later to compute the results of his observations, the necessity for his taking along the star catalogues still remained. This was recognized at the time the charts were published, and the preparation of a catalogue of stars giving the mean places, annual variation, etc., for 1910.0 of all stars plotted on the charts was put in hand. Owing to the small staff of the division and the press of other work, the compilation passed through a number of hands and finally had to be dropped altogether. It was not until the end of 1912, that the work was finally completed.

Just at this time a copy of Boss' Star Catalogue for 1900.0 was received. Now the results of large numbers of pairs of stars in zenith telescope observations had previously shown that those pairs of stars which had the largest residuals from the resulting mean latitudes were almost invariably pairs composed of either two Ambronn stars or one Ambronn and another star. For this reason the same confidence was not placed on Ambronn stars as on the stars of the other catalogues. When the positions of such stars as were given in both Ambronn and Boss were computed from both catalogues it was found that there were many stars which showed differences in declination as high as  $5''$  and some even as much as  $8''$  and over. It was decided therefore to revise the catalogue by giving the positions of such Ambronn stars as were in the Boss Catalogue from the latter catalogue. Mr. Waugh took this in hand, but was obliged to leave for the field before the revision was completed. The work was then carried on by Messrs. W. H. Herbert, B.Sc., and H. S. Van Patter, M.A.

The substitution of Boss for Ambronn stars had also shown that Boss' Catalogue contained a large number of stars available for our catalogue not given in the other catalogues. At the time that Mr. Herbert along with Mr. Van Patter took

up the revision, it was decided to further revise the catalogue by adding these Boss stars, and at the same time to substitute Boss positions for the *Connaissance des Temps* stars and for such Greenwich 1890 stars as were given in Boss.

In order to give some idea of the amount of work entailed in the preparation of the catalogue, it may be stated that about sixty thousand calculations were made. Each computation was made independently by two computers and the results compared. The computation and final checking were supervised by Mr. Herbert. The catalogue was further checked by using it to compute a number of latitude observations, the observations being checked by another computer using the original star catalogues. It is hoped that there are very few errors and that they are of small magnitude. It is to be borne in mind, however, that the catalogue is intended to take the place of the original catalogues only in the field or first computations. In the final computations in the office, the original star catalogues may still be used. The secular variation has been computed for all the stars. It is not given in the *Ambrohn Catalogue*. It will be found convenient therefore to use our catalogue in place of this catalogue in the office computations.

The inclusion of a large number of Boss stars not shown on the star charts necessitated a revision of the charts. This has been done by Mr. Herbert, and a new edition of the charts has been printed.

G. BLANCHARD DODGE.

Ottawa, 1914

## COMPARATIVE LIST OF DECLINATIONS FROM BOSS AND AMBRONN.

As stated in the Introduction, the Catalogue was originally prepared from the Berliner Jahrbuch, Nautical Almanac, Star List of the American Ephemeris, Connaissance des Temps, Greenwich Second Nine-Year Catalogue, 1900, Greenwich Second Ten-Year Catalogue, 1890, and Ambronn's Sternverzeichnis, 1900. As Ambronn was last in order of precedence, the Ambronn stars selected for our Catalogue were not given in the other catalogues. When the Boss Catalogue arrived and was compared with our catalogue, it was found that a great many of these Ambronn stars were given in Boss, but that there were many serious differences in declination. Tabulated below is a list of all the Ambronn stars in our catalogue superseded by Boss, whose declinations as given by Ambronn and Boss differ by 2" and over. The declinations are given for 1900.0, the common epoch of both catalogues.\*

## EXPLANATION OF THE CATALOGUE.

**DERIVATION AND NOMENCLATURE.**—The catalogue has been computed from the following ephemerides and star catalogues, precedence being given in the order named:—

Berliner Astronomisches Jahrbuch, 1910,  
British Nautical Almanac, 1910,  
Star List of American Ephemeris, 1910,  
Second Nine-Year Catalogue, Greenwich, 1900,  
Preliminary General Catalogue, Boss, 1900,  
Second Ten-Year Catalogue, Greenwich, 1890,  
Sternverzeichnis, Ambronn, 1900.

The symbols used for abbreviating the various catalogues are as follows:—

Symbol.	Star Catalogue.	Example.
B.J.	Berliner Jahrbuch, 1910.	B.J. 454 (Mittlere Sternörter). B.J. $\epsilon$ Ursae Minoris (Nördliche Polsterne).
N.A.	Nautical Almanac, 1910.	N.A. B.A.C. 4165.
A.E.	Star List of the American Ephemeris, 1910.	N.A. 35 Virginis.
Gr.	Greenwich Second Nine-Year Catalogue for 1900, pp. 3 to 33.	A.E. 32 H. Camelopardi.
Green.	Greenwich Second Nine-Year Catalogue for 1900 (Zones).	A.E. 70 Virginis.
B.	Preliminary General Catalogue for 1900, Lewis Boss.	Gr. 887
G.	Greenwich Second Ten-Year Catalogue for 1890.	Green. 8884
A.	Ambronn's Sternverzeichnis für 1900.	B. 3537
		G. 3812
		A. 4757

**STAR MAGNITUDE.**—The second column contains the star magnitude as given in the original star catalogue. Variable magnitudes are enclosed in brackets. Where a catalogue gives two values of magnitude for a variable star—maximum and minimum—the arithmetical mean is given, enclosed in brackets. In no case, however, does the minimum fall below 7.5.

## STAR POSITIONS.—

If  $\alpha_0$  and  $\delta_0$  = the right ascension and declination for any time  $T$ .

$\alpha$  and  $\delta$  = the right ascension and declination for any time  $T+t$ .

Then by Maclaurin's formula

$$\alpha = \alpha_0 + \left[ \frac{d\alpha}{dt} \right] t + \frac{1}{2} \left[ \frac{d^2\alpha}{dt^2} \right] t^2 + \dots$$

$$\delta = \delta_0 + \left[ \frac{d\delta}{dt} \right] t + \frac{1}{2} \left[ \frac{d^2\delta}{dt^2} \right] t^2 + \frac{1}{6} \left[ \frac{d^3\delta}{dt^3} \right] t^3 + \dots$$

where the differential coefficients in right ascension and declination,

$$\left[ \frac{d\alpha}{dt} \right], \quad \left[ \frac{d\delta}{dt} \right],$$

include both precession and proper motion.\*

MEAN RIGHT ASCENSION and MEAN DECLINATION.—The third and fifth columns contain the mean right ascension and mean declination respectively for 1910.0.

In the case of the B. J., N. A. and A. E. stars, these were taken directly from the catalogues. With the Boss, Greenwich and Ambronn stars the positions were computed as above, using the first and second differentials in the declination. With the close circumpolars the third term was investigated and where appreciable was applied. In order to dispense with the necessity of considering the third term in computing declinations from our catalogue, the positions of all stars whose declinations are north of  $83^\circ$  are given separately in a Catalogue of Stars from  $+83^\circ$  to  $+90^\circ$  declination for 1915.0, 1920.0 and 1925.0.

It will be noted that the data given for 1910.0 in this subsidiary catalogue for some of the stars differs very slightly from that given in the main catalogue for the same star. The reason for this is that the positions of all the ephemeris stars are deduced in the subsidiary catalogue from Boss, and are referred to as Boss stars. As they are fundamental stars, the differences are very small.

ANNUAL PRECESSION AND PROPER MOTION.—The fourth column gives the annual variation in right ascension  $\left[ \frac{d\alpha}{dt} \right]$ , and the sixth column the annual variation in declination  $\left[ \frac{d\delta}{dt} \right]$ . For the Boss, Greenwich and Ambronn stars, this had to be computed. The second differentials  $\left[ \frac{d^2\alpha}{dt^2} \right]$ ,  $\left[ \frac{d^2\delta}{dt^2} \right]$ , are given in the form of a change per 100 years in the Boss and Greenwich catalogues, but are not given in Ambronn.

If  $\left[ \frac{d\alpha}{dt} \right]_0$  and  $\left[ \frac{d\delta}{dt} \right]_0$  = annual variation in right ascension and declination, respectively, for the epoch  $T$  of the original catalogue,

and  $\left[ \frac{d\alpha}{dt} \right]$  and  $\left[ \frac{d\delta}{dt} \right]$  = annual variation in right ascension and declination, respectively, for the epoch  $T+t$  of our catalogue;

---

\* Doolittle's Practical Astronomy, p. 583.

$$\text{then } \left[ \frac{d\alpha}{dt} \right] = \left[ \frac{d\alpha}{dt} \right]_0 + \frac{t}{100} \left[ \frac{d^2\alpha}{dt^2} \right]_0$$

$$\left[ \frac{d\delta}{dt} \right] = \left[ \frac{d\delta}{dt} \right]_0 + \frac{t}{100} \left[ \frac{d^2\delta}{dt^2} \right]_0 + \frac{t^2}{2 \times 10^6} \left[ \frac{d^3\delta}{dt^3} \right]_0^*$$

the third term for  $\left[ \frac{d\delta}{dt} \right]$  being necessary only in the case of the close circumpolars.

**CHANGE PER YEAR IN ANNUAL PRECESSION.**—It was thought preferable to express the second differential  $\left[ \frac{d^2\delta}{dt^2} \right]$  in the form of a change per year rather than in a change per 100 years. It was necessary to compute it for every star, and it was calculated in one of the two following ways:—

(a) All the B. J., N. A., A. E., and some of the Gr. and Green. stars are given in the Boss Catalogue. The secular variation in declination for these and the Boss stars is calculated from the third term  $\frac{1}{6} \left[ \frac{d^3\delta}{dt^3} \right]$  as given by Boss.

If  $v_0$  = secular variation in declination for epoch  $T$  of the original catalogue  
 $v$  = secular variation in declination for epoch  $T+t$  of our catalogue,

$$\text{Then } \frac{1}{6} \left[ \frac{d^3\delta}{dt^3} \right] = \left( \frac{v-v_0}{t} \right) \left( \frac{10000}{6} \right).$$

This method assumes that the third term for 1905 is the same as the third term for 1900—an assumption sufficiently correct for such a short period.

For the Northern Circumpolars given in Appendix I of the Boss Catalogue the secular variation in declination is generally given for the year 1910. Where it is given only for 1900 and for 1925, the value for 1910 is interpolated as being directly proportional to the time.

(b) The secular variation for the remainder of the stars is calculated as follows:†

$$\left[ \frac{d^2\delta}{dt^2} \right] = \frac{dn}{dt} \frac{1}{n} \left( \frac{d\delta}{dt} - \mu' \right) - 15n \sin 1'' \left( \frac{d\alpha}{dt} + \mu \right) \sin \alpha - \dots$$

where  $n=20''.0607-0''.0000863t$  ( $t$  being interval in years elapsed since 1800),

$\mu$  and  $\mu'$  = proper motions in right ascension and declination respectively, and where in the above formula  $\frac{d\alpha}{dt}$  and  $\mu$  are expressed in time; and  $n$ ,  $\frac{d\delta}{dt}$  and  $\mu'$  in arc. Reducing, this formula becomes, for 1910.0

$$\left[ \frac{d^2\delta}{dt^2} \right] = -0''.0000863 \cos \alpha - 0''.001458164 \sin \alpha \left( \frac{d\alpha}{dt} + \mu \right).$$

**PROPER MOTION IN DECLINATION.**—The proper motion for each star is obtained from its own catalogue, except in the case of the star list of the American Ephemeris. As this catalogue gives no proper motions, the proper motions are obtained from the Boss Catalogue. The proper motions of many of the stars in the Boss Catalogue are modified by the secular variation in proper motion given by the term  $100\Delta\mu'$ .

If  $\mu'_0$  = proper motion in declination for the Boss Catalogue (1900.0)

$\mu'$  = proper motion in declination for our catalogue (1910.0),

Then  $\mu' = \mu'_0 + 10\Delta\mu'$ .

\* The third term is assumed to be ten thousand times the annual variation in secular variation. Boss tabulates one-sixth of this.

† Doolittle's Practical Astronomy, p. 589.

## REDUCTION OF STAR PLACES.

(The following is largely adapted from Hayford's Geodetic Astronomy).

The *mean place* of a star is its position referred to the mean equator and mean ecliptic, as distinguished from its position as referred to the actual or true equator and ecliptic. The equator and ecliptic as they would be if unaffected by periodic variations, in other words by nutation, are called the *mean equator* and *mean ecliptic*.

The *mean place* of a star, then, at a given instant, differs from the true place by the effect of nutation at that instant, and from the *apparent place* by the effects of both nutation and annual aberration.

To avoid inconveniences arising in the course of computations of star places, if any other form of year is employed in reckoning time, the astronomer uses what is called the *Besselian fictitious year*. The beginning of the fictitious year differs from the beginning of the ordinary year by a fraction of a day, which varies for different years.

The reduction from the mean place given in the catalogue to the apparent place for any given date is made in two steps.

Firstly, the mean place of the star is reduced from 1910.0 to the beginning of the fictitious year at some part of which its apparent place is desired.

If  $\alpha_0$  and  $\delta_0$  are the mean right ascension and declination as given in the catalogue, the mean right ascension and declination  $\alpha$  and  $\delta$  for the beginning of some year  $t$  are

$$\alpha = \alpha_0 + (t - 1910.0) \left[ \frac{d\alpha}{dt} \right] + \dots\dots$$

$$\delta = \delta_0 + (t - 1910.0) \left[ \frac{d\delta}{dt} \right] + \frac{1}{2} (t - 1910.0)^2 \left[ \frac{d^2\delta}{dt^2} \right] + \dots\dots$$

where  $\left[ \frac{d\alpha}{dt} \right]$ ,  $\left[ \frac{d\delta}{dt} \right]$  are the annual precession and proper motion in right ascension and declination, respectively, as given in the catalogue, and  $\left[ \frac{d^2\delta}{dt^2} \right]$  is the change per year in annual precession.

In the formula for declination given above only the first two terms of the expression are given. This is sufficiently accurate for all but the close circumpolar stars. With these stars the change in the change per year in annual precession is very often sufficient to make the application of the third term necessary. To avoid this and shorten the labour of reduction, the positions of all stars in the main catalogue whose declinations are between  $+83^\circ$  and  $+90^\circ$  are given separately in a subsidiary catalogue for every 5 years from 1910 to 1925. The reduction of declination to mean place at the beginning of the desired year is then made as above, taking for  $\delta_0$ ,  $\left[ \frac{d\delta}{dt} \right]$  and  $\left[ \frac{d^2\delta}{dt^2} \right]$  the data given for the epoch immediately previous to the year for which the declination is required.

Secondly, the mean place of the star is reduced from the beginning of the year to the apparent place at the given date. This involves reducing the mean place down to the given date and then applying to that result the effect of nutation and aberration at that date. This reduction has been put in the following convenient form:—

$$\alpha' = \alpha + f + \frac{1}{5} g \sin (G + \alpha) \tan \delta + \frac{1}{5} h \sin (H + \alpha) \sec \delta + \tau \mu \text{ (in time)}$$

$$\delta' = \delta + g \cos (G + \alpha) + h \cos (H + \alpha) \sin \delta + i \cos \delta + \tau \mu' \text{ (in arc)}$$

in which  $\alpha'$  and  $\delta'$  are the required apparent right ascension and declination respectively;  $\tau$  is the time elapsed from the beginning of the fictitious year expressed in a fraction of the year;  $\mu$  and  $\mu'$  are the annual proper motions in right ascension and declination respectively; and  $f, G, H, g, h$  and  $i$  are quantities called *independent star numbers*, which are functions of the time only, and are given in the Nautical Almanac (pp. 224-251, for 1915 Almanac) for mean midnight at Greenwich for every day of the year.

As an example:—An observation for latitude was taken 31.58 chains west of the northeast corner of section 35, township 108, range 18, west of the Fifth Meridian, on the 20th August, 1913. One of the stars observed was B.5218. Its apparent declination is wanted at the time of observation:—

From the catalogue

$$\alpha_0 = 20^{\text{h}} 16^{\text{m}} 11^{\text{s}}.4, \quad \text{annual variation} = + 1^{\text{s}}.48$$

$$\delta_0 = 55^{\circ} 06' 55''.32, \quad \text{“ “ “} = + 11''.204$$

$$\text{Change per year in precession} = + 0''.00175$$

$$\mu' = - 0''.020$$

When a number of star places have to be reduced, as in the case of a latitude observation, it will be found that the reductions can be made most expeditiously if all are carried along at the same time. On the forms provided, the star's mean right ascension for 1913 (to the nearest second or two of time), mean declination for 1910, annual variation in declination, change per year in annual precession and proper motion in declination should be filled in from the catalogue for all the stars at one time. It is not necessary to take out the values of  $\tau$ ,  $f$ ,  $G$ ,  $H$ ,  $\log g$ ,  $\log h$  and  $\log i$  for each star. The values for every full hour (sidereal time) of the observation may be interpolated from the values given in the Nautical Almanac and tabulated. Thus, if the observation began at 14<sup>h</sup>20<sup>m</sup> sidereal time, and continued until 23<sup>h</sup>30<sup>m</sup> the values of  $\tau$ ,  $f$ ,  $G$ ,  $H$ ,  $\log g$ ,  $\log h$  and  $\log i$  should be tabulated for 15<sup>h</sup>, 16<sup>h</sup>, 17<sup>h</sup>, . . . to 23<sup>h</sup> sidereal time for the longitude of the place of observation. The values for each star may then be taken from the table for the hour nearest the transit of the star. This will be found sufficiently accurate and will save considerable time.

The Nautical Almanac, Berliner Jahrbuch, American Ephemeris, etc., give the apparent position of a number of stars for every tenth day of the year. When the declination of one of these stars is required for a latitude observation, it is necessary to interpolate by second differences. If there are a number of such stars, this may be conveniently done as follows:—

If  $F_1$  is the required interpolated value of the declination for the time  $V_1$ ,  $F_2$  the declination for the time  $V_2$ ,  $V_2$  being the nearest stated time in the ephemeris to the time for which the interpolated declination is required,  $F_1$  and  $F_3$  the declinations for the nearest times  $V_1$  and  $V_3$  adjacent to  $V_2$  for which the declinations are given, then

$$F_1 = F_2 + \left[ \frac{F_2 - F_1}{V_2 - V_1} \right] + \left[ \left\{ \frac{F_3 - F_2}{V_3 - V_2} - \frac{F_2 - F_1}{V_2 - V_1} \right\} \frac{V_1 - V_1}{V_3 - V_1} \right] [V_1 - V_2]$$

As in the case under consideration  $V_3 - V_1$ ,  $V_3 - V_2$  are always equal to 10 and  $V_3 - V_1 = 20$ , the expression may be further simplified to

$$F_1 = F_2 + \left[ \frac{F_2 - F_1}{10} \right] \{V_1 - V_2\} \\ + [(F_3 - F_2) - (F_2 - F_1)] \left[ \frac{(V_1 - V_2 + 10)(V_1 - V_2)}{200} \right]$$

which will be found a very convenient form for rapid interpolation.

As an example: At the same place and date as given in the example for reduction of star's mean place from catalogue to apparent place at date, the star B. J. 707 or  $\alpha$  Draconis was observed.

Long. of place of obsn.  $0^h.324$  W. of Green.

Long. of Berlin.  $0.0372$  E. of Green.

Long. of place of obsn.  $0.36$  W. of Berlin.

Looking up to see whether the date should be entered as Aug. 19 or Aug. 20, we find that the sidereal time of mean noon for the 20th. Aug. is  $9^h52^m$  and as the right ascension of  $\alpha$  Draconis is  $18^h49^m$  we know the Berliner date can be entered as 20.36 or  $V_1 = 20.36$ .

The apparent declination of  $\alpha$  Draconis is given on page 341 of the Jahrbuch as follows:—

Aug. 8 or $V_1$	$59^\circ 16' 59''.7$	$= F_1$
	$+2.5$	$= F_2 - F_1$
" 18 or $V_2$	$62.2$	$= F_2$
	$+2.2$	$= F_3 - F_2$
" 28 or $V_3$	$64.4$	$= F_3$

(The arithmetical values of  $F_2 - F_1$  and  $F_3 - F_2$  are tabulated in the Jahrbuch. Attention must always be paid to the sign).

$$\text{Then } F_1 = 59^\circ 16' 62''.2 + \left[ \frac{+2.5}{10} \right] \{20.36 - 18\} \\ + [(+2''.2) - (+2''.5)] \left[ \frac{(20.36 - 18 + 10)(20.36 - 18)}{200} \right] \\ = 59^\circ 16' 62''.2 + 0''.590 - 0''.043 \\ = 59^\circ 17' 02''.75$$

In connection with the third term it will be noted that if  $V_1$  is taken for the middle of the observation,  $\left[ \frac{(V_1 - V_2 + 10)(V_1 - V_2)}{200} \right]$  may be considered a constant for each night,  $[(F_3 - F_2) - (F_2 - F_1)]$  varying with the stars. Where there is a number of stars for each night the values of the third term for  $(F_3 - F_2) - (F_2 - F_1) = ".01, ".02, ".03, ".04$  and  $".05$  are tabulated. It is then quickly applied for each interpolation.

## INSTRUCTIONS FOR THE USE OF THE STAR CHARTS.

The charts show all stars of the Star Catalogue.

If the transparent or upper sheet is placed on the opaque or lower sheet so that the horizontal lines of the upper sheet for that particular declination which is equal to the latitude is directly over the same line of declination through its whole length on the lower sheet, all stars on the upper and lower sheets on the same horizontal lines have the same zenith distance north and south from the observation spot, the black symbols showing through from the lower sheet representing stars of south zenith distance, and the red of upper sheet, stars of north zenith distance. The vertical lines show the times of transit of the several stars. Hence the working method:—The approximate latitude of the observation spot and the hours of right ascension during which it is desired to observe being known, those sets are selected which include the desired hours of right ascension. Place the upper sheet of each set on the lower with the vertical or right ascension lines corresponding and bring into coincidence the horizontal or declination line of both sheets for that particular declination which is equal to the latitude. Then select those pairs of south and north zenith stars within the limits of right ascension desired whose zenith distance is not too great, whose difference of zenith distance is not more than one-half the run of the micrometer and which have a suitable interval between transits. Having taken out the stars for limits of time allowed, there will probably be found long intervals in places between the different pairs. These may be filled in by extending the limit allowed for the difference of zenith distance to the full run of the micrometer. The pairs having thus been selected, the stars are identified in the Star Catalogue and their mean places in right ascension and declination are reduced from 1910.0 to the beginning of the year, which is sufficiently close for the purposes of the observing list.

39.5	.66	.68	.75	.81	.88	.99	1.13	1.32

NOTE.—If the altitude of the station is such that the barometer reading is below 27 inches, the tabulated values should be reduced by 10 per cent.

CORRECTION TO LATITUDE FOR DIFFERENTIAL REFRACTION.  $\frac{1}{2}(r-r')$

(The sign of the correction is the same as that of the micrometer difference).

$\frac{1}{2}$ diff. Zen. Dist.	Zenith Distances.							
	0°	10°	20°	25°	30°	35°	40°	45°
